

MAC UNIVERSAL ZOOM RESET GUIDE

Intel + Apple Silicon • Zoom Workplace + zoom.us

This guide is for the included **ZoomReset_Universal_Mac.command** file.

It closes Zoom, deletes Zoom data and local recordings, saves a log to the Desktop, and then tries to reopen Zoom.

WARNING: This is a wipe-and-relaunch tool. It can permanently delete local Zoom recordings.

BEST USE CASE

- Use it when Zoom is corrupted, stuck, looping, or acting broken on a Mac.
- Use the same script on older Intel Macs and newer Apple Silicon Macs.
- Do not use it if the user needs to keep local Zoom recordings or old Zoom app data.

HOW TO RUN IT

Step 1. Unzip the Mac kit and locate **ZoomReset_Universal_Mac.command**.

Step 2. Double-click the file. Terminal should open automatically.

Step 3. Read the on-screen message. The script may ask for the Mac password so it can clean shared Zoom folders too.

Step 4. Let it finish. It will try to reopen Zoom when cleanup is done.

IF MACOS BLOCKS IT

- Right-click the file and choose Open.
- If macOS warns about an unidentified developer, click Open again.
- If quarantine still blocks it, open Terminal in the same folder and run:

```
xattr -d com.apple.quarantine "ZoomReset_Universal_Mac.command"
```

WHAT THE SCRIPT DELETES

- Current-user Zoom application support folders
- Zoom caches, preferences, cookies, web storage, and saved state
- User log folders when found
- The user's Documents/Zoom folder
- Shared or machine-level Zoom folders if admin permission is granted

WHAT THE SCRIPT DOES NOT FIX

- Internet issues or firewall issues
- Zoom account bans or server-side restrictions
- Problems that require a full Zoom reinstall
- Files that were already deleted before the reset

WHAT THE USER WILL SEE

Screen or Prompt	What it means
Terminal window opens	The script has started running.
Password prompt	macOS is asking for admin permission to remove shared Zoom data.
No password entered or permission denied	The script still continues with current-user cleanup only.
Desktop log file appears	That log is the receipt showing what was removed, skipped, or failed.
Zoom opens again	The relaunch worked.

PLAIN-ENGLISH SUMMARY

This file is for Macs only. It shuts Zoom down, removes Zoom data, deletes local recordings, and then tries to open Zoom again. It works on Intel Macs and Apple Silicon Macs.

BEFORE YOU SEND IT TO SOMEONE

- Tell them their local Zoom recordings can be deleted.
- Tell them to use the Mac kit only if they are on a Mac.
- Tell them to right-click and choose Open if macOS blocks the file.
- Tell them a Desktop log file will be created.
