

MAC ZOOM RESET GUIDE

How to use **ZoomReset.command** on macOS

This file is a cleanup tool. It closes Zoom, deletes saved Zoom data, removes local Zoom recordings from your Documents folder, cleans some system Zoom files, and then opens Zoom again.

Important: do not run this if you need to keep local Zoom recordings or old Zoom settings.

- You may be asked for your Mac password.
- When you type your password in Terminal, nothing appears on screen. That is normal.
- After the reset, Zoom may ask you to sign in again.

WHAT THIS FILE DOES

- Stops Zoom and related Zoom processes.
- Deletes common Zoom folders in your user Library.
- Deletes **Documents/Zoom**, which is where local Zoom recordings are often stored.
- Deletes several shared and system-level Zoom folders by using **sudo**.
- Launches Zoom again by trying **zoom.us**, then **Zoom Workplace**, then **Zoom**.

WHO SHOULD USE IT

- Someone whose Zoom install is acting corrupted or stuck.
- Someone trying a full Zoom reset after repeated sign-in, cache, or app-data problems.
- Someone who understands this is a wipe-and-relaunch script, not a gentle repair.

STEP-BY-STEP

Use these steps exactly.

- **1. Put the file somewhere easy to find.**

Desktop or Downloads is fine.

- **2. Close Zoom first.**

Save anything important before you continue.

- **3. Double-click ZoomReset.command.**

A Terminal window should open.

- **4. Enter your Mac password when asked.**

No dots or stars will appear while you type. Press **Return** when finished.

- **5. Wait for the script to finish.**

It will stop Zoom, clean files, then try to reopen Zoom.

- **6. Sign back into Zoom if needed.**

A reset often clears stored app data and preferences.

IF MACOS BLOCKS THE FILE

- **Try Right-Click → Open** instead of double-clicking.
- If macOS warns that the file is from the internet, click **Open** if you trust the source.
- If it still does not run, open **Terminal** and use the commands below.

```
chmod +x ~/Downloads/ZoomReset.command
```

```
xattr -d com.apple.quarantine ~/Downloads/ZoomReset.command
```

```
~/Downloads/ZoomReset.command
```

Only use those commands if the file is in **Downloads**. If it is on the Desktop or somewhere else, the path must match the real location.

WHAT YOU SHOULD EXPECT

- Terminal messages saying Zoom is being stopped and cleaned.
- A password prompt before the system-level cleanup.
- Zoom opening again at the end, if it is installed normally.

WHAT THIS SCRIPT REMOVES

This is the plain-English version of the cleanup list.

USER-LEVEL ITEMS

- Zoom application support data in your Library.
- Zoom cache files and web storage.
- Zoom preferences and saved application state.
- Zoom cookies and WebKit data.
- Zoom logs found in your user Library logs folder.
- Your local **Documents/Zoom** folder.

SYSTEM-LEVEL ITEMS

- Shared Zoom support folders under **/Library** and **/Users/Shared**.
- System-level Zoom preferences and logs.

BLUNT WARNING

This script is aggressive. It is designed to wipe Zoom data and start fresh. That is useful when Zoom is broken, but it is the wrong tool if the person wants to keep local recordings, app preferences, or cached login state.

FILE NAME TO KEEP

Leave the file name as **ZoomReset.command**. The **.command** ending is what makes it act like a runnable macOS script file.
